

User Story 311

The screenshot shows the RAG Pipeline interface with the 'TEST & PREVIEW' tab selected. The 'Test Prompt Template' section displays a sample query: 'When scheduling CT/MRI/ultrasound, the system should auto-verify insurance via API, trigger pre-authorization if required, and store approval details. If not covered, it must notify coordinator and patient with alternate payment options. This reduces manual errors and delays in billing workflows.' Below this, the 'Sample Test Cases (JSON)' section shows a JSON array with one test case: 'TC_305', 'Laboratory', 'Lab Report Email Notification - Validated Results', and a description: 'Verify that the system sends email notification to patients when lab test results are validated and marked as complete by the technician.' The test steps include: '1. Technician logs into Laboratory module'.

Test Cases Generated

The screenshot shows the RAG Pipeline interface with the 'TEST & PREVIEW' tab selected. The 'Test Cases Generated' section displays a list of test cases. The first test case is 'TC_305', 'Laboratory', 'Lab Report Email Notification - Validated Results', and the description: 'Verify that the system sends email notification to patients when lab test results are validated and marked as complete by the technician.' The test steps include: '1. Technician logs into Laboratory module', '2. Select pending test for Patient UHID: 123456-7', '3. Enter test results in result_values field', '4. Click 'Validate Results' button', '5. System marks test status as 'VALIDATED'', '6. Verify email sent to patient registered email', and '7. Verify notification logged in patient_notification'.

Below the test cases, there are buttons for 'COMPLETE RAG PIPELINE' and 'SAVE CONFIGURATION'.

At the bottom, there is a section titled 'Complete RAG Pipeline Results (10-Steps)'.

TC_6355

Successful Pre-authorization for CT Scan

Radiology

P1

Functional

Patient has valid insurance coverage

1. Launch the application

2. Login to the application with valid credentials

3. Navigate to Radiology module

4. Select patient and raise radiology investigation for CT scan

5. System verifies insurance via API and triggers pre-authorization

6. Pre-authorization is approved and details are stored

Pre-authorization is successfully approved and stored in the system

TC_6356

Unsuccessful Pre-authorization for MRI

Radiology

P1

Functional

Patient has invalid insurance coverage

1. Launch the application

2. Login to the application with valid credentials

3. Navigate to Radiology module

4. Select patient and raise radiology investigation for MRI

5. System verifies insurance via API and triggers pre-authorization

6. Pre-authorization is rejected and notification is sent to coordinator and patient

Pre-authorization is rejected and notification is sent to coordinator and patient with alternate payment options

Patient has

1. Launch the application

2. Login to the application with valid credentials

3. Navigate to Radiology

Total Test Cases: 10

Modules Represented: 1

Priority Distribution: P1: 7 | P2: 2

💡 Generation Rationale

- TC_6355: Covers successful pre-authorization workflow
- TC_6356: Covers unsuccessful pre-authorization workflow
- TC_6357: Covers pre-authorization workflow with existing approval
- TC_6358: Covers edge case with invalid patient details
- TC_6359: Covers edge case with insurance API failure

📋 Recommendations: Develop additional test cases to cover more edge cases and negative scenarios

💰 Cost Breakdown: Generation: 5400 tokens (\$0.000392) | RAG Summary: 2611 tokens (\$0.000000) | Total: \$0.000392
